Defining the problem:

The case study our team chose was the Grafton South Early Years Centre. The Centre's values are strongly aligned with their community and making sure South Grafton can "Strengthen cultural connections" (AbSec, 2026) through the care they provide for South Grafton's youth. The Centre has stated they are looking to streamline their operations using technology that doesn't increase administration work. As a result, our team needed to focus on methods of making a product that would be simple for all users as to not make something our stakeholders would not use. This design ensures that we are designing the product in the right way for our stakeholders that are using the product.

Our stakeholders requested specific elements, such as enrolment and contact information, as well as attendance tracking for when kids can't attend school due to being unwell, specifically, in "a supportive rather than punitive way." (Swinburne University Of Technology, 2026) As a result, our product needs to enable the teachers and other school staff to be able to input data efficiently so they can spend more time focusing on the development of the children, supporting the pillars of kinship, culture and connectedness.

Another requirement the stakeholders asked of us was to implement follow up measures for when children miss sessions, implementing the core pillar of country, the South Grafton Centre has a core philosophical focus on improving the connectedness of their students to their country, therefore this system would further aid this connection using the right language. The right language also ensures its accurate, making sure the children are taught the correct information, and it is delivered in a culturally sensitive way to the target audience.

Ensuring we can address the needs and wants of the stakeholders when developing this program ensures South Grafton is able to continue to educate young kids on Indigenous practices whilst minimizing the time spent on administrational tasks. This will promote child development and enable the teachers to deepen the knowledge that the children have of their indigenous heritage.

Scoping the solution:

Our team determined that to meet the requirements the shareholders have set, we would need a database, online catchup platform, dashboard, and parental contact page. Using our user stories, the group was able to determine the best solution to the problem would be an interactive learning application, where everything is built within the app.

Teachers and staff of the school want an app that isn't hard to use and is more efficient than their current method to make sure they can quickly get work done, this implies that they want an easy to use app, where everything is self-contained doesn't link to other websites, to do this, our team decided a home page or dashboard would be the best use as to not overwhelm new users. This user story also influenced our design philosophy to have everything self-contained unlike some other learning sites, which will link to other websites which can make things complicated and unintuitive for the user. Kids also have this preference so ensuring that this requirement is met is one of our "must have" prioritizations.

Parents want quick access to contact information about staff, to call them in case of an emergency or vice versa. Our project plan includes a dedicated menu for contact details, ensuring this is made in the right way for efficient use when it comes to every type of user. The pillar of connectedness was considered in this part of the project, as this will link individuals with each other as well as with data, and organizations such as SNAICC.

Elders in the South Grafton community want to make sure that the data of enrollment, attendance, and contact details are all kept safe and handled responsibly. The right way to handle this data involves heavy encryption keys and changing these often, as well as making sure that the data is cleared when unusable. Parents also want this data to be kept safe as it's their children's data, so our team took extra steps to make sure we address this properly.

SNAICC would want to be able to see all the parts of the product seamlessly and at once, to effectively overview the project when necessary. A seamless app was deemed one of our "should have" requirements as it's not completely necessary to make but would be incredibly useful for all parties, especially SNAICC, parents, teachers and students alike.

Alternative approaches and justification of our solution:

An alternative approach would be to use paper records for attendance and enrolment, alongside phone calls and printed learning activities. This approach would be familiar to staff and families and would allow the Centre to continue operating without reliable internet access. Printed activities could also help families support their children's learning at home without needing a device. However, the staff would need to manually organize records, identify missed sessions, and contact families individually. This potentially increases administrative work and makes information harder to update or locate. This approach would support families who prefer physical materials but would not fully address the Centre's aim of making its daily operations more efficient.

A different approach would be to use a pre-existing learning platform alongside separate tools for attendance and family communication. This can reduce the initial development time, as the Centre could use the established features rather than develop every function themselves. Depending on the platform, both the maintenance and technical support could also be provided externally, however separate systems could also require staff to enter the same information more than once. The families may also need to move between different applications to access learning activities, announcements, and contact details, making the process harder to navigate. Any existing platform would also need to be assessed for its costs, privacy settings, and ability to support community decisions about cultural knowledge. A platform suitable for general education would not automatically make it appropriate for the Centre. Due to this, before committing to any development, the team would assess whether an existing platform does or could meet these requirements within one system and support the community's access rules.

Our preferred solution is an integrated learning application/system that connects attendance, catchup materials, announcements, and contact details together through one dashboard. The educators could record a missed session and make relevant learning activities available to the child's family within the same application. This would support follow ups in a helpful way, while reducing the need to move information between separate systems. The parents would have a clear place to find announcements, learning materials, and the appropriate contact details.

This approach would require more development, staff training, and ongoing maintenance. Bringing information together also means that access permissions and recovery arrangements would need to be established from the beginning. However, it better supports the identified requirements for simple navigation, reduced administration, and controlled access to personal and cultural information. Being able to develop the application in stages would allow staff and families to test the main functions before

additional features are introduced. The application would support face-to-face learning, with printed materials and direct contact remaining available for families who need them.

Designing the solution components:

Our solution would be an integrated learning application / tool that would be made of three components: a Learning and Cultural hub, a Connect hub, and a Family and Attendance records hub

The Family and Attendance Records component is the foundation of the system. Its purpose is to give the Centre one trusted place for enrolment details, consent choices, emergency contacts, attendance, transport needs and waiting list information, entered once and reused everywhere else. Educators and family support workers enter and view this information; the director administers access, and families see only their own child record. It supports the Centre's requirements for enrolment and contact information with culturally respectful consent, supportive attendance follow-up and secure storage that builds community trust. We chose to record consent separately for each type of information, such as photographs or sharing with health services, rather than as a single tick box, so that families stay in control of how their information is used.

The Learning and Cultural Hub records children's learning, cultural activities and transition-to-school planning, and gives families catch-up activities when a child misses a session. Educators and local cultural knowledge holders create the content, families view it, and children engage through simple play-based activities. It supports the documentation requirement, the learning side of attendance follow-up and secure storage of Cultural materials sit in a protected area with their own access rules, because Elders and knowledge holders decide what is uploaded, who can see it and whether it can be shared, and they can withdraw permission at any time. We favored learning stories and activity packs over test-style lessons because they suit early years children and do not add to educators' workload.

The Connect Hub is the single front door to the system, combining a staff dashboard with plain-language family communication. Staff use it to see participation patterns, waiting lists and transport needs, while families receive notices, reminders and contact details in one place, and the director and SNAICC can view an overview. It supports plain-language communication and a simple, strength-based dashboard. We deliberately use positive wording, such as "families who may need transport support" rather than "at-risk families",

to respect the Centre's request to avoid harmful labels. It draws on the other two components and sends nothing back except messages.

The components work as one system through shared information. When an educator records a missed session in Family and Attendance Records, a gentle follow-up prompt appears. The educator sends a plain-language message through the Connect Hub with a matching activity pack from the Learning and Cultural Hub attached, and the dashboard reflects participation trends without naming any family negatively. This means information is entered once, follow-up is supportive rather than punitive, and administration stays low.

Our key design decisions involve trade-offs. We chose an integrated application over existing platforms to avoid double entry and to keep cultural and personal information under the Centre's control, accepting greater development, training and maintenance costs. An onsite server would give the Centre more control over its data, but it depends on community approval and on the Centre being able to maintain it securely. We limited the feature set to daily tasks, so some nice-to-have features wait for later stages, and we keep paper and phone options for families who prefer them, accepting some double handling. For sustainability, the system uses the Centre's existing devices and Wi-Fi, works offline where connectivity is unreliable, is administered by trained local staff so the Centre is not dependent on the developers, and comes with plain-language handover documentation and a realistic maintenance budget. Consent and cultural access controls move into the "Now" stage of the roadmap because protections must exist before any information is collected.

Developing a product roadmap and engagement timeline:

Product overview

The product roadmap uses a Now, Next and Later structure to show which features will be developed first, why they are important and what benefits they will provide to the school.

Now	**Next**	**Later**
Database	Homepage	debugging
Online learning platform	Staff contact page	Appearance of application
Announcement system	Announcement Page	Scalability features
Video Conference compatibility	Interactive lessons (as opposed to slideshows)	Multiple languages
	Parental contact information	
	Secure data storage cultural knowledge	

Now – Essential Features (Weeks 1–4)

The first stage of the process will focus on developing the core function of the site

- Database: store all the information collected from the students, including attendance and enrolment information and staff records.
- Online learning platform: Allows teachers to upload learning materials so absent students can catch up
- Announcement system: allows the teachers to inform their students of future tests
- Video Conference compatibility: the platform can support or connect with video conferencing so that sick students can still attend their class from home.

Why these features come first is because they are the main functions that support students and teachers. They help improve school administration, communication, and access to learning.

Next – Additional Features (Weeks 5–8)

The second stage focuses on improving the overall quality of the site by making easier users access and interact with the system.

- Homepage: provides a central location where students, teachers, and parents can access different parts of the website
- Staff contact page: allows students and parents to find information about their teachers
- Announcement Page: displays important school news and upcoming tests and homework for students and parents
- Interactive lessons: Allows students to participate in learning activities (e.g.: test base learning activities where the student is question on what they learned at end of the study)
- Parental contact information:
- Secure data storage for cultural knowledge:

Why do these features come next once the main system functions have been developed These features will make the platform easier to navigate, more organized and more engaging for students and it also makes sure that all of the data collected for the indigenous learning is secure and protected.

Later – improvements and Future Development (Weeks 9–12)

The final stage focuses on improving the quality and long-term usability of the application while improving sustainability.

- Multiple languages: Makes the platform easier to use for students and families that speak different languages and aren't proficient in English.
- Scalability features: Allows the system to support more students, teachers, and information as the school grows.
- Appearance of application: Improves the website's layout, colors and overall design.
- Debugging: Identifies and fixes problems to improve system reliability.

Why these features come later: is because you can make improvements so that the site can be expanded after the main functions are developed. They help ensure the system remains accessible, reliable, and suitable for future growth. Essential security testing and bug fixing will still occur during earlier stages.

Timeline	Activities	Expected outcomes
Week 1	Obtain school approval and consult teachers, students, parents and elders	Confirmed project requirements
Weeks 2–4	Develop database, online learning platform, announcement system and video conference compatibility	Main system has been developed
Weeks 5–6	Create homepage, staff contact page and announcement page	Users can navigate and access information easily
Weeks 7–8	Develop interactive lessons for the children to use	Improve learning engagement
Weeks 9–10	Debug the application and improve its appearance	Improve reliability and usability
Weeks 11–12	Investigate scalability and multiple-language support	Help the future development of the school's systems
Onwards	Collect feedback, review security and evaluate system performance	Keep the system effective and sustainable

Application of the five pillars and five rights:

"Introduce the concepts of Two-Eyed Seeing and the Five Rights, which emphasize respectful collaboration, Indigenous leadership, cultural safety, and the protection of Indigenous knowledge and data" (Swinburne University Of Technology, 2026)

We recognise the importance of epistemic humility in building meaningful relationships with our stakeholders and acknowledge that our understanding of the community's needs and experiences is inherently limited by our own perspectives. We are committed to developing sustainable, inclusive, and culturally appropriate solutions that genuinely respond to their needs. Recognising the potential gap between the assumptions and intentions of the development team and the lived experiences of the community, we aim to bridge this divide by grounding our solution design in the Five Pillars and Five Rights. This framework helps us guide our approach towards a solution that is community-centred, organisational, and responsive to the needs of the Grafton South Early Years Centre.

1. **Right People**:

We have drafted a list of stakeholders who will play a key role in structuring the solution design. These high-priority stakeholders include Elders, Parents and the educators and staff, SNAICC, and most importantly the kids. Our other stakeholders (not from the community) include NSW Department of education, the development team, and other professionals who have knowledge working with indigenous projects.

Justification for selected Right People in our project:

It is important from the developer side to find and designate reliable "right" people from the community who could provide valuable insight for creating a roadmap, collecting organisational data, and verifying the solution is effective as well as contextually relevant.

Through consulting Elders, would significantly improve the longevity of the project and gain their confidence in it. Further, assuming that the Elders in Grafton Centre could teach us how the Centre conducts their daily tasks and events, and the cultural obligations we must follow to work with them. Thus, being a guiding voice and providing valuable insights that the non-communal stakeholders might miss out.

Parents and kids are an integral part of our solution design as they are the primary benefactors of our project upon completion. The parents would work closely with the educators to shape our learning platform application as efficient and child-friendly it could be. The parents will be the facilitators who would utilise our platform the most on behalf of their kids, assuming they are educated or could be educated to properly navigate and apply the system we design.

Kids are given opportunities in their early learning centre to show the impression and voice their ideas, which would be duly noted and integrated to the system.

We consider the educators and staff as the administrators of the learning platform. We intend to collaborate with them to model all the features and functionality of the system and ask their support in running trial runs. Assuming they could provide us with their valuable time to work alongside and familiarize themselves with the platform.

SNAICC and NSW Department of education would act as a guide in the structuring of roadmap. Assuming that they could keep in touch and offer suggestion on how to approach with the Grafton South Early Years Centre and the community with project. Their agenda being "Every child deserves a solid foundation in life". SNAICC advocates for, "supports and contributes to the development of early childhood programs and systems that are designed, governed and delivered by Aboriginal and Torres Strait Islander peoples." (SNAICC, 2026)

From Indigenous and community Perspective:

The selected stakeholders would be just as important in the designing of the solution. As both the participants and users their voice would be heard and their concerns noted. We acknowledge that collaboration among stakeholders cannot be assumed to occur seamlessly or without delays. However, with the “right people” no aspects affecting their culture, spirituality, data or rights would be overlooked.

Connection to Five pillars:

- **Country:** Consulting Elders, family and community honours their authority to speak for land and ensures decisions respect its cultural and spiritual significance.
- **Kinship**: Identifying the Right People means recognising family and community networks who can speak and make decisions for Grafton South Early Years Centre.
- **Culture**: As they are the holders of cultural and environmental knowledge, which is critical for solution design and roadmap.
- **Journey**: We acknowledge historical and ongoing experiences of the community, ensuring processes contribute positively.
- **Connectedness**: Working with these Stakeholder is beneficial to our development process as well as they are both the participants and recipients of the solution.

2. **Right Place**:

We understand the need to have locations that respect cultural protocols and provide a safe, appropriate environment for dialogue. We ensure this by setting meetings and study groups at places like the early child Centre, communal hall, and other places approved by the right people to represent the community, Elders, staff, and SNAICC.

Justification for selecting Right Place in our project:

Every decision, implementation made throughout the solution design must be approved from both sides, and a common place would facilitate these meetings. Moreover, we propose that the school serve as the central hub for housing the servers and hardware needed to support the learning platform. Assuming we get the green flag from the stakeholders.

From Indigenous and community Perspective:

Ease of reaching the meetings and ensure grounded discussion. They are informed about all the infrastructural additions that we wish to make. “It is not just about physical location; it also includes creating an environment where cultural safety and respect are upheld.” (Swinburne University Of Technology, 2026)

Reflection on the Five Pillars:

- **Country**: Holding meetings on these communal places acknowledge its spiritual and cultural significance.
- **Kinship**: Choosing these spaces where families, educators and community networks can participate supports decision-making and respects their time.
- **Culture**: Respecting protocols about where certain conversations occur can safeguard cultural integrity and sometimes teach us more about the culture.
- **Journey**: This would go long way to prove that we are working more mutual gains
- **Connectedness**: Meeting in culturally safe environments strengthens relationships and collaboration between different stakeholders.

3. **Right Language**

Any ideas, concerns or comments on the work should be addressed in the right language. We would make efforts to speak in a simple, understanding format without any technical terms to keep the stakeholders in our discussions.

Why it is important and how we wish to implement:

We also recognize the importance of Aboriginal language and therefore assigning Experts in local Gumbaynggirr language integration in our meetings. We would also follow AIATSIS terminology guide for culturally appropriate language. Additionally, the system interface must be easily understood and navigable by the educators and parents, right language ensures it.

From Indigenous and community Perspective:

Communication and approval are the basis for laying foundation to a solution design. As the custodian of the land, Grafton Centre community ‘s suggestions will be clearly recorded. Mutual understanding would be fostered.

Connection to Five pillars:

- **Country**: Right Language respects the stakeholder's land and its cultural significance.
- **Kinship**: Communication would honor cultural protocols, and addresses people appropriately.
- **Culture**: Using culturally safe language preserves traditions and avoids misinterpretation on uncertainties.
- **Journey**: It would greatly impact the speed and approval of the project.
- **Connectedness**: Clear, respectful language strengthens relationships and trust among stakeholders.

4. **Right Time**

"Time is not just a calendar concept - it is relational and connected to cultural practices, ceremonies, and Country." (Swinburne University Of Technology, 2026)

Why it is important and how we wish to implement:

We acknowledge the need to respect cultural obligations, seasonal activities, and community priorities. Therefore, the time for meetings, designs, and surveys would be conducted aligned to the community calendar. There would be a checklist instead of a fixed deadline. We would ask for suitable dates and Avoid scheduling during "Sorry Business" or cultural ceremonies.

From Indigenous and community Perspective:

We understand that there might be considerable delays when scheduling every stakeholder's time for engagement. Therefore, the meeting would be divided into groups to match related stakeholder at a time and later engaging with other groups to approve and further widen the data collection, design and testing. Assuming we could accommodate educators with elder, educator with parent, kids with educators and so on.

Relations to Five Pillars:

- **Country**: Respect for Seasonal cycles and land-based activities at Grafton Centre.
- **Kinship**: Family obligations and community events shape timing.
- **Culture**: Ceremonies and cultural practices dictate when engagement is appropriate.

- **Journey**: Every scheduling would include the stakeholders throughout the completion of the project.
- **Connectedness**: Aligning project timelines with community would strengthen collaboration and solution design.

5. **Right way**

“It is about how you approach consultation, decision-making, and collaboration—not just what you do”. (Swinburne University Of Technology, 2026)

Justification for the Right Way we have adopted:

Being in contact with the person without disrespecting the community of elders or the other members and organizations. We would follow cultural protocols such as Welcome to Country and permission seeking. We would be transparent and share information openly and explain how decisions will be made. Our approach includes:

Child educators/support staff send a formal email explaining our project its use, sustainable gains, and their role in it. Once we get approval, we have an in-person meeting to discuss scheduling.

For Elders, Approach the people of the Grafton community so that you can set up a meeting with the elders. Engage in their communal activities to further understand the culture.

For SNAICC, we wish to contact the origination member through their services and contact numbers so that you can set up a meeting with the representative member. Assuming they would play a mediator or a supervisor role in the project.

For families and kids, Have the kids take a letter to their parents so that you can set a meeting with the families in the community. Assuming, parents could be encouraged to attend study groups at the Centre.

Assembly for kids in center where they could take part in shaping their learning platform with art ideas and suggestions

Connection to Five Pillars:

- **Country**: Respecting cultural protocols when working on Country through permission, ceremonies.
- **Kinship**: Following norms when engaging with Elders and families.

- **Culture**: Honoring traditions and practices in consultation and decision-making.
- **Journey**: Recognizing historical experiences and ensuring processes supporting healing and empowerment.
- **Connectedness**: Building genuine partnerships through culturally respectful methods.

Data management, governance and cybersecurity considerations:

The application would manage children's enrolment, attendance and learning information, parent contact details, staff records, and approved cultural learning materials. Each type of information should have a clear purpose, for example attendance would support follow ups after missed sessions, while contact details would allow the educators to communicate with families. Only the information needed for these functions should be collected, with families receiving clear explanations of their use and how to request corrections. The information gathered during co-design would also need specific handling. Requested paper notes from meetings and workshops would be kept in a locked cabinet at the Centre while a nominated staff member would transfer the relevant findings into a protected project folder, remove unnecessary identifying details and participants to check the summary. Voice recordings would only be made with separate consent, which would then be transferred to encrypted storage, checked to confirm the transfer was successful, and then deleted from the recording device. Before collection, participants would be told the retention period. Once the summary is approved and the period ends, paper notes would be shredded and recordings securely deleted with backup copies removed through the agreed deletion process. (Office of the Australian Information Commissioner, 2018)

The Centre would approve the applications storage arrangements, including whether the proposed onsite server can be maintained securely. Digital records would be encrypted, with a separate encrypted backup and regular recovery checks. The parents would only access their own child's records, while educators would access information needed for their work. Developers would use fictional records for testing, and external stakeholders would receive summaries without identifying details unless additional access is specifically authorized.

The relevant Elders and knowledge holders would decide which cultural materials can be uploaded, who can access them, and whether copying or sharing is permitted. Their approval would be recorded which each resource and reviewed when its use changes. Withdrawing permissions would trigger the removal from available learning materials and

management of stored copies according to the agreed process. (Global Indigenous Data Alliance, n.d.)

A nominated administrator would manage the accounts, remove staff access when they leave, and keep track of how long each type of information should be stored and when it should be deleted. As part of this, when an application record eventually reaches the end of its approved storage period, the administrator would securely delete it and ensure backup copies expire through the agreed process. To further protect the information, the staff would use individual accounts, strong passwords, and multifactor authentication. They would also receive training on how to understand and counteract against misleading messages/phishing attempts, check recipients, and report suspected breaches. The administrator would respond by restricting affected access, further investigating the incident, and coordinating communication with affected families if needed. Video sessions would use controlled invitations and would not be recorded by default. These protections would be established before collecting necessary information, including cultural materials introduced in later development stages. (Australian Signals Directorate, 2025)

Discussion of design solutions, sustainability and trade-offs:

Design Decisions

We chose to develop the main function first because they are core part of the systems that way the teacher and the students can start using the systems and then we can add the other systems like the homepage and contact pages later making these functions easier to implement and easier to access by the students and staff we also decided to introduce interactive lessons after the basic learning platform because interactive activities require more development time.

Sustainability

To make the system sustainable, we will:

- plant trees for emissions server produces
- cleanup parks/beaches as part of school activities
- Install solar Pannels for sustainable power source
- Use the school's existing Wi-Fi and devices where possible
- Choose affordable hosting to reduce ongoing costs

- Maintain and update the system regularly
- Design the platform so it can support more users in the future
- Provide learning activities that balance online learning with students' screen-time needs

Trade-offs

Trade-off	Reasons
Cost vs features	Develop essential functions first to reduce initial costs
Online learning vs screen time	Allow students to catch up from home while encouraging appropriate screen time
Security vs convenience	Use secure login and access permissions to protect student information
Basic lessons vs interactive lessons	Start with basic learning materials because they are easier and faster to develop
Scalability vs cost	Start with a system suitable for the school and expand when required

Appendix:

User stories:

As a teacher, I want a simple system so that I don't waste time on administrative work

As an elder, I want an eco-centric development process so that our environment does not suffer because of the program

As SNAICC, I want the development of early childhood programs designed, governed and delivered by Aboriginal and Torres Strait Islander people and assured safety and wellbeing of Aboriginal and Torres Strait Islander children

As a parent, I need the UI to be easy to navigate so I can easily understand what my child needs to catch up on and communicate when they can't attend.

As a kid, I want the technology that is going to be implemented to not be distracting so that I can retain the most information in my classes

As SNAICC, I want to engage and amplify the voices of Aboriginal and Torres Strait Islander children, youth, families, communities and the sector so that progress towards the fulfilment of Aboriginal and Torres Strait Islander children's rights are met

As a kid, I want new technology to help me improve my learning habits and my learning capabilities so that I can be successful when I go to school.

As an elder, I want new technology to help people learn about cultural knowledge and how to respect cultural heritage so **that cultural** knowledge and cultural heritage is not lost to time.

As a Parent/Guardian, I want clear communication alongside knowing my child's information is safe, so I can be informed of their learning while protecting their privacy

As a child, I want my achievements in learning (grades) to be stored so it can be shared with my family

Prioritized requirements:

MUST have
Attendance records
Information for students to catch up on missed work
Dashboard for basic navigation

Parental contact information
Children's personal information secured
Secure data storage cultural knowledge

SHOULD have

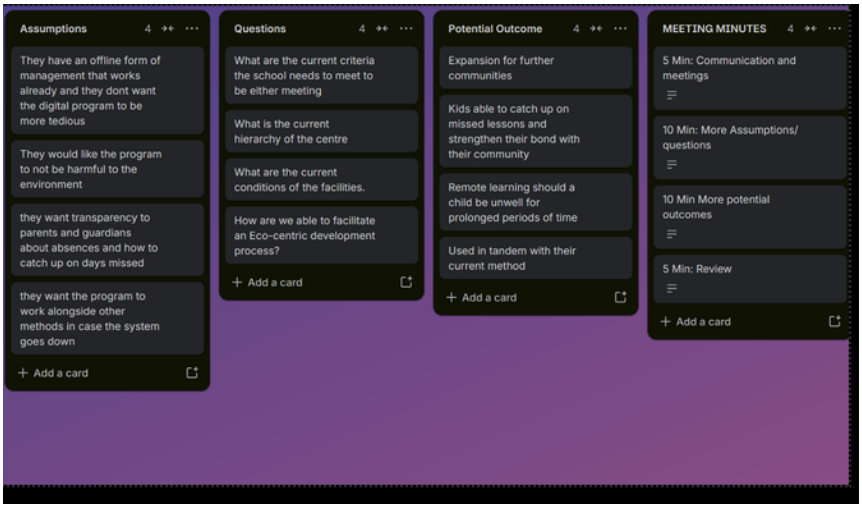

Enrolment form
Waiting lists to contact teacher
Reminders
Respectful and inclusive language
Include cultural learning activities
Time activities

COULD have
Form for transport needs
Family support number
A way to view/update my child's information
Video Lessons

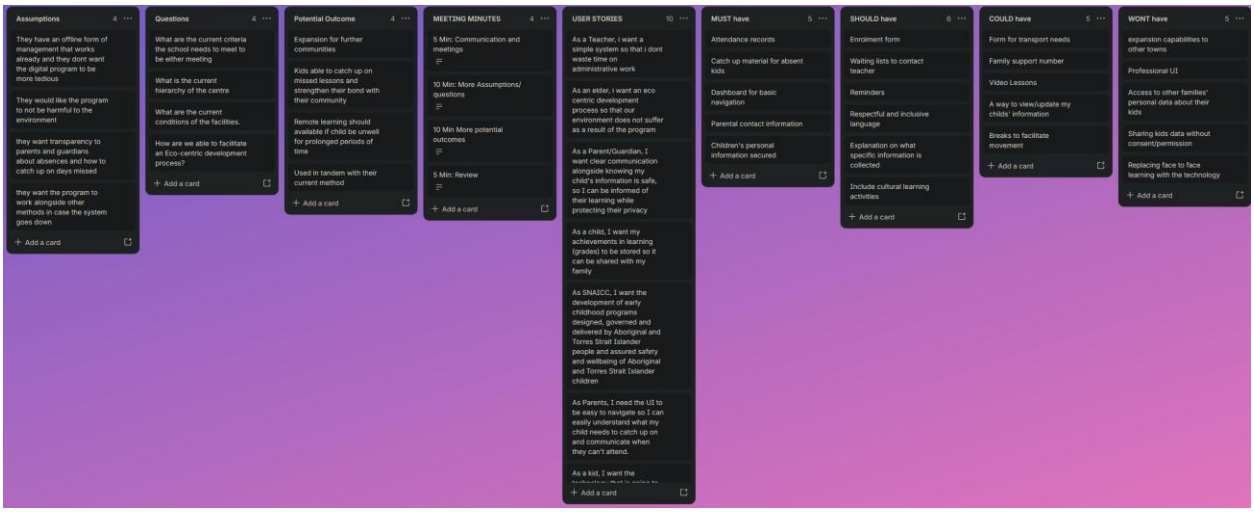

WON’T HAVE
expansion capabilities to other towns
Sharing kids' data without consent/permission
Replacing face to face learning with the technology

Team wide use of Trello:

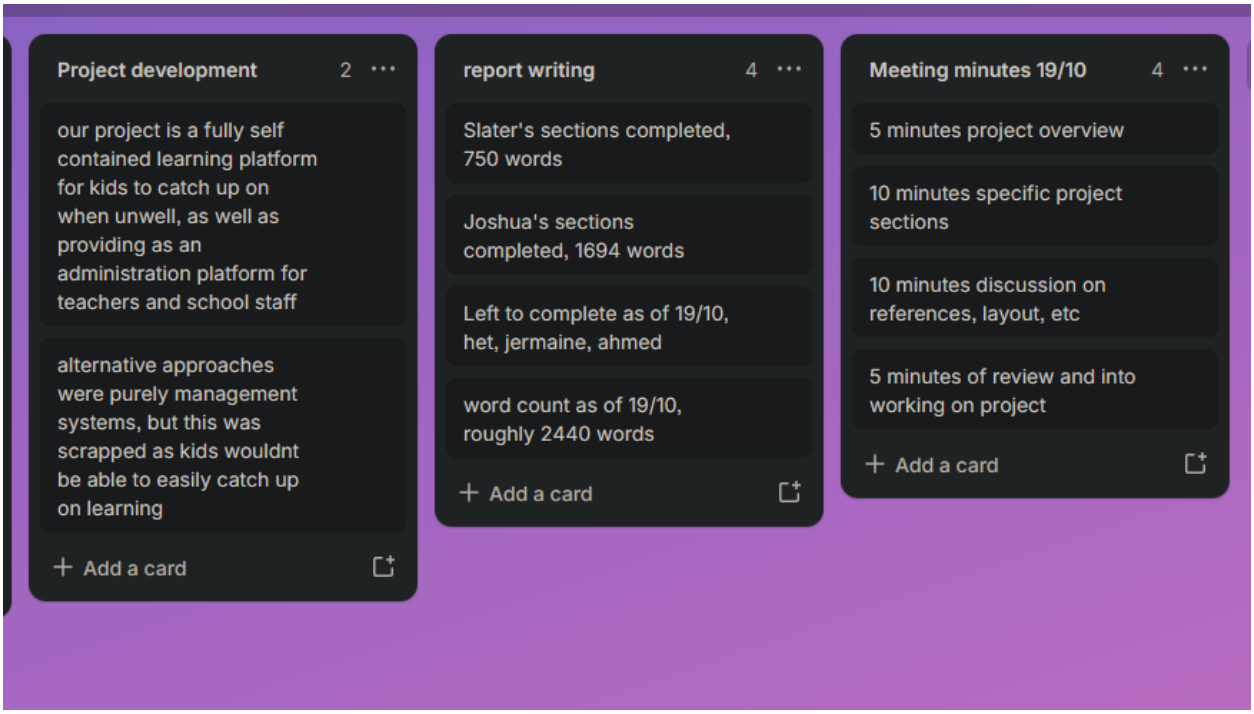

Screenshot from week 8

Screenshot from week 10

Screenshot from week 11 (rest of board not included for visibility reasons)

Evidence of two meetings:

Meeting minutes 1

Held Tuesday week 7pm 23/09/26

5 mins on communication and future meetings

Slater suggested catching up once a week, when possible, to make sure we are all on the same page regarding

10 mins on more assumptions regarding the project

Assumptions of note included that the Centre was likely already using Wi-Fi, that the children and staff are already semi-tech literate, etc.

We also had questions, such as how many people would be using the platform daily, what other features the stakeholders might want, how an organization like SNAICC would want to be able to view the project, etc.

10 mins of potential outcomes

The group discussed making the project scalable to other rural communities, what would be needed to make that happen, and if it would be something to do during project development or afterwards

5 mins review

Reviewed what we covered, and covered the pre workshop material for the Wednesday class

Meeting minutes 2

Held Monday 19/10/26

5 mins of project overview

Discussing the writeup for the project proposal, analyzing the rubric

10 mins specific project sections

Our group discussed who would take what part of the proposal, and what their section should cover

10 mins discussing layout, referencing, and other presentation elements

5 mins review

The team reviewed our discussions, then we went into working on the group project independently
