Pre Class:
In Week 10, teams will participate in structured Learning Circles to review and discuss proposed solutions, product roadmaps, and design decisions. Working with other teams, students will practice professional communication, provide constructive feedback, evaluate strengths, risks and assumptions, and develop an improvement plan to strengthen their final project proposal before submission.

Following workshop 9, each team should bring their solutions to a point where it can be shared with others in the class. Teams should also decide who will take which roles in a Learning Circle. **Students will need to read the documentation on Learning Circles in module 10 before class.**

To prepare effectively for the next week, complete all outstanding learning content for this topic, before navigating to week 10.

from 10.6:
This workshop contains in-class assessment. For the Learning Circles, teams will be divided into smaller groups of 2-3 people of their choosing. Teams should decide in advance who will participate in each group, who will present particular aspects of the proposal, and how responsibilities will be shared during the discussion. If a team only has 1 student in attendance, they will not be able to present their proposal and will receive a 0 for the overall task this week.

https://swinburne.instructure.com/courses/77253/pages/10-dot-4-learning-circles?module_item_id=5993082

Assignment criteria:

Important notes

- This is a workshop-based assessment. Your team must begin the task during the on-campus session.
- Active participation matters — students who are not present or not contributing in class may not receive marks.
- You will complete 2–3 short activities, each producing a small outcome (e.g. notes, summaries, or diagrams).
- Keep your responses clear and concise — focus on capturing your thinking, not perfect presentation.

Workshop 10 activity

Criteria	Ratings					Pts
Learning circles	**1 Pts** **Proficient** Team actively participates in both learning circles by presenting the team's proposed solution, contributing constructive and respectful feedback, responding to questions, and engaging in discussion with other teams. Demonstrates effective team collaboration through equitable contribution, active participation, respectful communication and engagement with workshop activities, as observed in class.		**0.5 Pts** **Developing** Team participates in both learning circles and contributes to discussion and feedback. Demonstrates effective collaboration through participation by most team members and engagement with workshop activities, as observed in class.		**0 Pts** **No marks** Limited or no meaningful participation in the learning circles.	1 pts
Feedback synthesis and improvement planning	**2 Pts** **Proficient** Systematically reviews feedback received from both learning circles and identifies appropriate actions in response. Feedback is critically evaluated and justified decisions are made about what to retain, revise, investigate, validate or decline. Team works well together to develop a clear and actionable improvement plan that demonstrates how feedback will be used to strengthen the final proposal.	**1.5 Pts** **Developing** Reviews feedback received from both learning circles and identifies appropriate actions in response. Decisions are generally justified and the improvement plan demonstrates a clear connection between feedback received and proposed changes to the solution. Demonstrates effective collaboration through participation by most team members in analysing feedback and identifying improvements.	**1 Pts** **Satisfactory** Reviews feedback received from the learning circles and identifies some appropriate actions in response. Demonstrates consideration of feedback, although analysis, justification or proposed improvements may lack depth, clarity or completeness. Demonstrates some participation in team discussion and improvement-planning activities.	**0.5 Pts** **Needs improvement** Provides limited review of feedback or limited evidence of how feedback informs proposed improvements. Analysis, justification or planned actions are unclear, incomplete or superficial.	**0 Pts** **No marks** No submission or no meaningful contribution to the feedback review and improvement planning activities.	2 pts
						Total points: 3

Needed for class:

- your product roadmap, including milestones, dependencies and next steps

This was a roadmap I was told would be better reading off our week 9 feedback, this is more product focused which is what she was looking for

Now	**Next**	**Later**
Database	Homepage	debugging
Online learning platform	Staff contact page	Appearance of application
Announcement system	Announcement Page	Scalability features
Video Conference compatibility	Interactive lessons (as opposed to slideshows)	Multiple languages

Key milestones:
Approval to use the new product in school
Multiple successful information sessions to help better understand the product among teachers and students
creation of database
Creation of homepage
Creation of contact page
Creation of learning platform
Making site look nice and bugfixing

dependencies:
Homepage is needed to make other parts of site navigable
Contact information is needed for contact page to function
Data on student's attendance and enrolment information is needed for database; teacher contact information is also needed

Next steps:
Make website look nicer and link all pages cleanly
Add support for interactive pages

- your system or product components, such as an architecture diagram, component list, prototype or interface map

  Component list:
  homepage
  database/attendance records
  Contact information page
  Learning catchup system

- a brief project overview

Our project will be an online system that both teachers and students use to either streamline administration duties, catchup on learning in the event of sickness, and allow for contact with staff and parents, using a database, learning platform, announcement page for events and contact information page together so unwell students can keep learning and deepening their connection to country

- your proposed technical solution and reasons for selecting it

We chose our technological solution as it makes the workflow of teachers and school staff more efficient, and lets students that cannot attend otherwise catch up on their learning from home and not fall behind

- relevant requirements, constraints, risks and assumptions

Requirements:
Records of student attendance
Teacher contact information
Enrolment information
Online learning tools (uploading slideshows)

Constraints:
Takes money to host server on which the platform is held
Schools and educators need Wi-Fi and laptops or iPads

Risks:
data could be leaked if handled poorly
Kids need limited screentime which conflicts with the online catchup idea

Assumptions:
School already has Wi-Fi
Kids and parents are already tech literate

two or three questions on which your team would like feedback

How do we keep the technology used from being harmful to kids?

What other uses could our website have? Anything unique for parents or SNAICC?

How could we develop this with an eco-centric design? Could we offset the server emissions with more plants and greenery?

Reflection:
one strength identified:

One risk/assumption/perspective to investigate:

One change we will consider:
One practical next step for improving the project:

Activity 1: ASSESSED
learning circle

<u>recorded feedback</u>

Group one liked our idea and thought limiting the screentime for kids was a good idea

They suggested that we should offset the emissions of the server by planting trees in a green space

Group 2 - well thought out aspects and questions answered

Thought about funding which they hadn't thought of before

<u>recorded questions</u>

How will you make it culturally appropriate

How will you limit the use of your tech by kids

Can it function on more remote wifi's (bad connection)?

Some tech literacy needed from the users of the system? (Somewhat, but there would be tutorials on how to use)

Is it more of an option/addon or are the features/system all online?

Measures to insure correct access with information to children's data? (Authentication methods and more in-house work rather than sourcing the data/system out)

What are the key risks of the program?

Low connectivity workaround

Training for parents and educators on how to use the application

Activity 2: ASSESSED
learning circle

recorded feedback

This group liked the sound of our idea, thought the idea of the application being self-contained was good

They advised we go further in depth on our data protection practices

recorded questions

How will this be different from other learning platforms?

How will you offset the emissions of the server?

Will the program be child safe?

Activity 3:

Feedback raised by both teams

Both teams had questions regarding privacy of the children and data control

Feedback connected to the “MUST HAVE” requirements

Our group was suggested to add secure encryption to keep data safe

We were also given feedback about the app being self-contained, which falls under the learning platform requirement

Feedback about Authority, Control, or Access

We were suggested to have permissions to invite specific staff and individuals to view specific content

Conflicting feedback

Group one agreed that tech access for children should be limited, whereas group two was more open to longer exposure to digital learning tools

New questions

How will teacher access to specific content be granted?

What methods will we use to authenticate that the person is the correct parent/guardian?

Feedback requiring evidence or validation

Feedback	Classification	Team response	component effected
“Offset emissions of server”	investigate	“we are going to further look into ways of offsetting carbon emissions to keep an eco-centric design philosophy”	all
“Properly encrypt data of children”	investigate	“as the privacy of the kids using the system is the primary concern, we will further research	database

		data encryption methods."	
"Different than other learning sites"	retain	"we are glad that this is a key incentive of our program and will be keeping this in mind moving forward	all
"More exposure to online learning tools"	decline	"we think the screen time of kids should be limited and will not be implementing this feedback"	Online learning system

Activity 4: ASSESSED

For each action from the feedback: THIS IS A TEMPLATE, PLEASE COPY PASTE BELOW

Who is responsible?

What needs to be completed?

Which proposal section will be affected?

Feedback 1: Differenciate to other learning sites
Who is responsible?

Developers (us)

What needs to be completed?

Develop the project in a self-contained ecosystem, this way it is unique and leaves staff and students happy with the application and what it provides to their education and careers

Which proposal section will be affected?

The product itself will be affected, specifically the home navigation screen and contact pages as theyll be used the most, but all parts of our application need to be made with this design philosophy

Feedback 2: Offset server emissions
Who is responsible?

Teachers, developers, SNAICC, kids

What needs to be completed?

Potentially trees need to be planted, green spaces need to be added, and cleaning up beaches, these all-offset emissions

Which proposal section will be affected?

The project itself is affected minimally, but it affects the eco centric design protocols we have implemented into the program, as it demanded we come up with unique ways to implement these concepts.

Feedback 3: further investigate how to keep child data safe
Who is responsible?

Developers, Teachers, SNAICC

What needs to be completed?

Proper research and implementation of data encryption methods, data deletion and offline data archival all need to be looked into, and then implemented dependent on the groups decision on each method.

Which proposal section will be affected?

In the program, the data records of the students and teachers will be directly effected, as the data will be encrypted itself. This feedback is relevant to our data governance and ownership and proper implementation of the data into the program.
